

ENGINEERING AND AUTOMATION SERVICES

Enitial provides on-site maintenance and servicing of equipment for utilities, remedial, and sampling and monitoring services across the UK. We act as our customers' site services team to keep their specialist machinery and equipment fully operational 24-7.

While most contemporary landfill sites in the UK have installed gas extraction and control systems, many require regular repair, replacement or expansion.

Utilities, remedial, and sampling and monitoring services require specialist equipment for reliable operation and accurate results. The design, installation and regular maintenance of this equipment by experienced technical experts helps companies adhere to regulations and keep services running.

Enitial's specialist team of experienced engineers provides on-site installation, maintenance and aftercare of landfill gas and leachate control infrastructure including drilling, excavation, civil engineering, pipe work installation and bespoke fabrications.

We offer innovative, cost-effective solutions for site engineering needs including remote telemetry, sensing and pollution control monitoring systems.

Our engineering services also include on-site installation, maintenance, and aftercare of gas extraction systems, solar-powered pumps and pneumatic pumps.
